
Data centres, in your backyard. And 90 more on the way.

Hi Miguel,

From Melbourne's western suburbs to Lane Cove, Queensland to Kemps Creek, communities across Australia are organising against a growing number of data centres and AI infrastructure proposals near homes, heritage sites and waterways.

Over 55,000 people have signed petitions on Change.org opposing developments they say were approved with little community consultation.

In Melton, a [local resident who also works in tech started a petition](#) signed by more than 5,200 people. **"I know what data centres are, and I know what they do to communities that host them,"** the petition starter writes. **"This isn't industrial land. It's our home."**

[A national petition by Bella Mark](#), signed by more than 11,500 people, raises broader concerns. **"What happened to the NetZero plan?"** she writes.

Proponents of these developments point to an economic upside. The federal government's National AI Plan frames the boom as central to

economic growth and the clean energy transition, with announced commitments including **\$20 billion from Amazon and \$5 billion from Microsoft.**

More than 160 data centres are already operating in Australia, with another 90 on the way.

Whether you support or oppose the AI boom, it will change the Australian landscape and economy, and **Change.org is where you can make sure you have a say.**
